?? Questions?? Call 503.982.9429

Drinking Water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800.426.4791.

A special note for the immune deficient. . . some people may be more vulnerable to contaminants in drinking water than the general popula-Immune-compromised persons such as persons with cancer undergoing chemotherapy, persons with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. people These should seek advice about drinking water from their health care providers. CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline at 800.426.4791.

> Drinking Water Week May 1–7, 2016 YOUR WATER

To know it is to love it! Consider honoring this week by checking for and fixing any leaks at your home or business!

HUBBARD PUBLIC WORKS appreciates the opportunity to serve you — and hopes you are able to use this report as a positive tool to better understand the water you use every day.

Thank you!!! City of Hubbard Public Works

2015 Drinking Water Quality Report

This report is designed to inform you about the quality of water you drink and use every day.

Where does your water come from? Most, if not all, of Hubbard's groundwater comes from rain and snowmelt which filters through the soil at the surface and has percolated down to the aquifer in the Troutdale Formation. The City routinely monitors for contaminants in your drinking water according to Federal and State laws. All sources of drinking water are subject to potential contamination by substances which are naturally occurring or man-made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably

be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. In order to ensure all tap water is safe to drink, the EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. The FDA regulations establish limits for contaminants in bottled water. As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic and organic chemicals, and radioactive substances. More information about contaminants and potential health effects can be obtained from the Environmental Protection Agency's Safe Drinking Water Hotline at 800.426.4791.

In November, 2015 a boil-water alert was issued in Hubbard due to a positive test result for E Coli in one routine sample. Working with the Health Department, Staff initially took repeat samples as required, however the same sample site came back positive for total coliform. Fortunately the risk to the public was low as positive samples appeared to be isolated in the same area (City Hall), however, with the safety of the community a #1 priority, the boil-water needed to be issued. Staff worked to resolve the issue by increasing chlorine and flushing lines, and continuously monitored progress with testing throughout the City. The boil-water alert was lifted as soon as possible. As a precaution, Staff kept the chlorine residual higher than normal for several weeks before slowing tapering it back down. An investigation was

completed as to the cause of the positive samples, however the results of the investigation were inconclusive. Speculation included the possibility that the culprit was old piping underneath City Hall. Staff obtained a grant to replace the piping in this area, and it was completed earlier this year.

ARE YOU READY for the next emergency? Are you signed up for emergency notifications through our local dispatch center, Metcom? If not, please log in to www.METCOM911.com - on the right side of their homepage you will see a box with big blue letters which says: "Citizen Alert, Notification Sign Un" - click on this box and it will walk you through

E. Coli are bacteria that indicate the water may be contaminated with human or animal waste.

Total Coliform are bacteria that are naturally present in the environment and are used as an indicator that other potentially harmful bacteria may be present.

ARE YOU READY for the next emergency? Are you signed up for emergency notifications through our local dispatch center, Metcom? If not, please log in to www.METCOM911.com - on the right side of their homepage you will see a box with big blue letters which says: "Citizen Alert, Notification Sign Up" - click on this box and it will walk you through the process of signing up. When the City has important EMERGENCY info to share, this notification system plus the reverse 911 system are the first and best way the City has to communicate with you. Please call Hubbard Public Works at 503.982.9429 if you have any questions - and thank you for being a part of our community's emergency preparedness team!

Contaminant	Violation Y/N	Level Detected	Unit Size	MCL	MCLG	Likely Source Of Contamination

Total Coliform	res					Found throughout the environment. Can be an indi-
		tine; 3 Positive				cator other bacteria may be present.
		Repeat Samples				

<u>Violations</u>: As mentioned on Page 1, in response to the positive routine test for E. Coli, the City had to issue a boil-water alert in November, 2015 which was an Acute MCL for Fecal Coliform/E. Coli violation.

DEFINITIONS

MCL: The maximum contaminant level "Maximum Allowed" is the highest level of a contaminant allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. MCLs are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect. MCLG: The Maximum Contaminant Level Goal "The Goal" is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

PARTS PER MILLION (PPM): One part per million is equal to:

⇒ One minute in two years, or

⇒ One cent in \$10,000.00

PARTS PER BILLION (PPB): One part per billion is equal to:

 \Rightarrow One penny in \$10,000,000, or

⇒ One minute in two thousand years.

MFL: Microfiber per Liter.

PCI/L: A unit of radioactivity corresponding to one decay every 27 seconds in a volume of one liter, or 0.037 decays per second in every liter of air.

ND: None detected in the City's water.

??? QUESTIONS — CONCERNS ??? Give us a call at 503.982.9429

Thank you — Hubbard Public Works

Source Water Testing: Effective in 2012, the City is required to test our source water at each of our well sites each year. These tests have been completed in **2015** and all tests **PASSED**.

Lead: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.
